

PHP Assignment - Data Visualisation

I never worked with PHP, so this assignment was the very first PHP related project I ever did. I had trouble with seeing the possibilities one can achieve with using PHP. Normally, when using known website syntax as CSS and HTML I can easily achieve what I am aiming for. This time it was different.

As I stated earlier I had trouble with getting an idea of what to do. Although after some extra explanation from Valerie I had come up with an idea. I wanted to visualize the crashes from the world of Formula one racing. Immediately after starting the project I changed the approach and visualized every winner of a 2015 race. By clicking on the image one could find out what crashes happened in that particular race.

In the project I spent most of my time getting the PHP code up and running. Since I had not had the syntax all clear in my head I made a lot of stupid errors. Errors which costed time to find and fix. Luckily enough I was able to finish my project in the way I wanted.
